Introduction

Study context

Misspecification is active research area for Bayesian SEMs

- Levy (2011): Posterior predictive checking using the likelihood ratio test; Bayesian SRMR
- Hoofs, van de Schoot, Jansen, and Kant (2018): Bayesian RMSEA
- Garnier-Villarreal and Jorgensen (2020): Several translations of frequentist fit indices: RMSEA, CFI, TLI, ...
- Cain and Zhang (2019): Deviance information criterion

- Wu and Browne (2015) have done this in frequentist context:
 - Parameter estimates have greater uncertainty about them reflecting degree of model misspecification
 - Estimates the RMSEA as a model parameter
- We could simply recreate Wu and Browne (2015) in a Bayesian context, but:
 - The RMSEA is not so easy to interpret (e.g. Chen, Curran, Bollen, Kirby, & Paxton, 2008; Savalei, 2012)
 - The SRMR has clearer interpretations
 - Model misspecification so parameter estimates reflect degree of model incorrectness, while estimating an SRMR-type index

- Wu and Browne (2015) have done this in frequentist context:
 - Parameter estimates have greater uncertainty about them reflecting degree of model misspecification
 - Estimates the RMSEA as a model parameter
- We could simply recreate Wu and Browne (2015) in a Bayesian context, but:
 - The RMSEA is not so easy to interpret (e.g. Chen et al., 2008
 Savalei, 2012)
 - The SRMR has clearer interpretations
 - Model misspecification so parameter estimates reflect degree of model incorrectness, while estimating an SRMR-type indexes

 - Model misspecification so parameter estimates reflect degree of model incorrectness, while estimating an SRMR-type index.

Model

CFA as an example

Begin with Muthén and Asparouhov (2012):

$$\Sigma = \underbrace{\Lambda \Phi \Lambda^{\mathsf{T}} + \Delta}_{\mathsf{Standard}} + \underline{\Psi} \tag{1}$$

 Λ : Loading matrix, Φ : Interfactor correlation matrix, Δ : Standard residual covariance matrix (often diagonal)

 Ψ : Residual covariance matrix, with all off-diagonal elements estimated. Assumed to reflect the influence of minor factors (MacCallum & Tucker, 1991)

 Ψ is not identified: Muthén and Asparouhov (2012) apply an inverse-Wishart prior with known parameters to attempt to shrink elements in Ψ to zero.

CFA as an example

Begin with Muthén and Asparouhov (2012):

$$\Sigma = \underbrace{\Lambda \Phi \Lambda^{\mathsf{T}} + \Delta}_{\mathsf{Standard}} + \underline{\Psi} \tag{1}$$

 Λ : Loading matrix, Φ : Interfactor correlation matrix, Δ : Standard residual covariance matrix (often diagonal)

 Ψ : Residual covariance matrix, with all off-diagonal elements estimated. Assumed to reflect the influence of minor factors (MacCallum & Tucker, 1991)

 Ψ is not identified: Muthén and Asparouhov (2012) apply an inverse-Wishart prior with known parameters to attempt to shrink elements in Ψ to zero.

CFA as an example

Begin with Muthén and Asparouhov (2012):

$$\Sigma = \underbrace{\Lambda \Phi \Lambda^{\mathsf{T}} + \Delta}_{\mathsf{Standard}} + \Psi \tag{1}$$

 Λ : Loading matrix, Φ : Interfactor correlation matrix, Δ : Standard residual covariance matrix (often diagonal)

 Ψ : Residual covariance matrix, with all off-diagonal elements estimated. Assumed to reflect the influence of minor factors (MacCallum & Tucker, 1991)

 Ψ is not identified: Muthén and Asparouhov (2012) apply an inverse-Wishart prior with known parameters to attempt to shrink elements in Ψ to zero.

Goal is to model misspecification

$$\Sigma = \underbrace{\Lambda \Phi \Lambda^\mathsf{T} + \Delta}_{\mathsf{Standard}} + \Psi$$

Let ψ_{ij} $(i \neq j)$ be off diagonal elements in Ψ , reflecting misspecification / minor factor influences.

To model minor factor influences:

$$\underbrace{\frac{\psi_{ij}}{\sqrt{\sigma_{jj}\sigma_{ii}}}}_{\mathsf{SRCs}}\sim\mathcal{N}(0, au),\,\,\, au\sim\mathcal{N}^+(0,1)$$

 $\sigma_{ii/jj}$: indicator variances i.e. SRCs: standardized residual covariances.

Goal is to model misspecification

$$\Sigma = \underbrace{\Lambda \Phi \Lambda^{\mathsf{T}} + \Delta}_{\mathsf{Standard}} + \underline{\Psi}$$

Let ψ_{ij} $(i \neq j)$ be off diagonal elements in Ψ , reflecting misspecification / minor factor influences.

To model minor factor influences:

$$\underbrace{\frac{\psi_{ij}}{\sqrt{\sigma_{jj}\sigma_{ii}}}}_{\mathsf{SRCs}}\sim\mathcal{N}(0, au),\,\, au\sim\mathcal{N}^+(0,1)$$

 $\sigma_{ii/jj}$: indicator variances i.e. SRCs: standardized residual covariances.

A hierarchical model for SRCs

$$\underbrace{\frac{\psi_{ij}}{\sqrt{\sigma_{jj}\sigma_{ii}}}}_{\mathsf{SRCs}} \sim \mathcal{N}(0,\tau), \ \ \tau \sim \mathcal{N}^+(0,1)$$

Implications

- SRCs are assumed to be zero on average
- SRC scale parameter (τ) is the root mean square error of SRCs with location constrained to be zero
- ullet au is akin to the correlation root mean square residual (CRMR)
- ullet Smaller values of au reflect a model with smaller SRCs, lower misspecification OR smaller influence of minor factors
- $\tau < 0.05 \implies \mathsf{most} \ \mathsf{SRCs} < 0.10$

A hierarchical model for SRCs

$$\underbrace{\frac{\psi_{m{ij}}}{\sqrt{\sigma_{m{jj}}\sigma_{m{ii}}}}}_{\mathsf{SRCs}}\sim\mathcal{N}(0, au),\,\,\, au\sim\mathcal{N}^+(0,1)$$

Implications

- SRCs are assumed to be zero on average
- SRC scale parameter (τ) is the root mean square error of SRCs with location constrained to be zero
- ullet au is akin to the correlation root mean square residual (CRMR)
- ullet Smaller values of au reflect a model with smaller SRCs, lower misspecification OR smaller influence of minor factors
- $\tau < 0.05 \implies \text{most SRCs} < 0.10$

A hierarchical model for SRCs

$$\underbrace{rac{\psi_{ij}}{\sqrt{\sigma_{jj}\sigma_{ii}}}}_{\mathsf{SRCs}}\sim\mathcal{N}(0, au),\,\,\, au\sim\mathcal{N}^+(0,1)$$

Implications

- SRCs are assumed to be zero on average
- SRC scale parameter (τ) is the root mean square error of SRCs with location constrained to be zero
- ullet au is akin to the correlation root mean square residual (CRMR)
- \bullet Smaller values of τ reflect a model with smaller SRCs, lower misspecification OR smaller influence of minor factors
- $\tau < 0.05 \implies \text{most SRCs} < 0.10$

Simulation studies

- 1. Can the proposed approach recover model parameters?
 - Yes, upcoming
- 2. Can differences in τ between competing models be used for model selection?
 - Lacks power, more promising to use approximate leave-one-outtooccopic cross validation to select between competing models.
- 3. Can the Ψ matrix be used to detect specific residual covariances that are too large?
 - Yes, especially for larger samples

Simulate data with minor factor influences (Ψ)

5 modeling approaches

- Two **ignore** minor factor influences:
 - 1. Freq: Standard frequentist
 - 2. Baseline: Standard Bayesian
- One **fixes** the size of minor factor influences:
 - 3. AZ: Muthén and Asparouhov (2012)
- Two **estimate** the size of minor factor influences:
 - 4. LKJ: another proposed method (in paper)
 - 5. NRM: hierarchical normal method (focus here)

Simulate data with minor factor influences (Ψ)

Study 1: Empirical coverage rate of 90% CI.

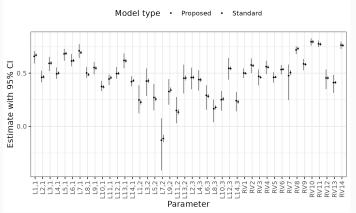

L: loading; RV: residual variance; rho: interfactor correlation

Findings:

- Freq and Baseline models fail when sample size or au is large
- Performance of AZ model deteriorates at large τ
- Methods that estimate the size of minor factor influences perform as expected

An empirical example: Hospital Anxiety and Depression scale

Bifactor model parameters, $n=21820, \tau=0.028$. Note narrow intervals for the *Standard* approach.

LX.Y are loadings of factor Y on item X; RV: residual variances. Standard estimates are from a model without Ψ .

Closing

Discussion

Discussion points / future work

- There is an R package for this: minorbsem
- Package also includes:
 - Bayesian implementation of Wu and Browne (2015) method.
 - Other prior assumptions for standardized residual covariances e.g. lasso, generalized double Pareto (global-local)
 - Global-local prior on all cross-loadings, relaxing simple structure
 - These features are yet to be tested via simulation
- Extensions to other data types are also worth considering
 - Additional issues/extensions are on GitHub: https://github.com/jamesuanhoro/minorbsem/issues/3
